

6

The honesty record: 35 negative results, every one kept

Numbered in the order they were found, grouped by what broke. The five that changed what the paper can claim are called out. In most cases a plausible, well-formatted, wrong answer was available.

THE FIVE THAT CHANGED WHAT THE PAPER CAN CLAIM

- NR-13

With mass fixed and diameter free, the optimum was a heat shield heavier than the vehicle
- NR-15

The nose-radius lever has no ceiling in the model, so the front sits on a placeholder
- NR-18

The physics changed under a live study, and nothing in the runner noticed
- NR-25

Both fine-mesh sphere cases ended in a limit cycle and failed the force criterion; the Courant number, not the criterion, was changed
- NR-35

H2 not supported: extra CFD bought nothing here, and the study's target was beyond its own search budget

Entries and titles read from docs/negative_results.md (headings verbatim); dates are the first git commit in which each heading appears in that file. Counts: solver 13, model exploit 7, tooling trap 9, study design 6. The grouping by kind is this figure's reading of each entry (the paper's §17 groups them by consequence); the five call-outs are the ones §17 and §8.2 build on. Squares outlined in ink = called out.
